Abstract of DE 4428467 (A1)

A syringe with piston damping has a cylinder (1) and a piston (4) for pushing the liq. (13) such as a medicament. The piston (4) is sepd. from a compression piston (8) behind it by a compressible medium (12) such as air. The compression piston is hand actuated and the injection speed is pref. adjusted by altering the volume of the compressible medium. The syringe outlet opening has a high flow resistance (e.g. a thin spinal needle).
